Survey Methodology

The survey was designed and conducted by Public Religion Research Institute. The survey was made possible by The Carnegie Corporation of New York and Public Interest Projects/Four Freedoms Fund. Results of the survey were based on bilingual (Spanish and English) RDD telephone interviews conducted between July 23, 2014 and July 27, 2014 by professional interviewers under the direction of SSRS. Interviews were conducted among a random sample of 1,026 adults 18 years of age or older in the continental United States (512 respondents were interviewed on a cell phone).

The final sample was weighted to six different parameters—age, sex, geographic region, race, education and telephone usage¹—to ensure reliable and accurate representation of the total adult population.

The margin of error for the survey is +/- 3.1 percentage points at the 95% level of confidence. In addition to sampling error, surveys may also be subject to error or bias due to question wording, context and order effects.

¹ Telephone usage refers to whether respondents have only a landline telephone, only a cell phone or both types and the frequency with which they use each type.
